FOR IMMEDIATE RELEASE

Amoateng Technologies Limited and Kumasi Metropolitan Assembly Launch Six-Month Zero-Cost Electronic Waste Recycling Partnership

KUMASI, Ashanti Region, Ghana. Amoateng Technologies Limited (ATL), a sustainability engineering company based in Kumasi, and the Kumasi Metropolitan Assembly (KMA) have entered into a six-month e-waste recycling partnership with effect from 31st August 2026. Under the agreement, ATL will collect, safely process and report on electronic waste gathered across the metropolis through its flagship venture, Trashless Tech, entirely at no cost to the Assembly. The partnership covers the collection and safe processing of discarded electronics, the recovery of valuable materials including copper and gold, and the publication of impact reporting for the Assembly. It also carries a public education mandate, under which the partners will teach households what electronic waste is, why it must never be burned or dumped, and how to route it out of the general waste stream and into safe hands.

The agreement builds on the documented record of the Trashless Tech nine-month internal pilot. In that pilot the venture diverted 575 kilograms of electronic waste from dumping and burning, processed more than 30 personal computer units and observed safe handling practices throughout. As the partnership scales, Trashless Tech is working toward diverting the equivalent of 15 tonnes of carbon dioxide emissions each year. The partners are asking every household, school, shop and office in the metropolis to do two simple things. The first is to drop off e-waste at the KMA Waste Management Department in Adum. Residents may bring discarded electronics to the Department's premises in Adum free of charge, where items are received, recorded and passed to Trashless Tech for safe processing. No appointment is needed and there is no fee.

The second is to separate e-waste from household waste. When the various waste collection companies bring their trucks around to collect household waste, residents should keep electronic waste out of the organic and plastic waste they hand over. Food waste goes with food waste, plastics go with plastics, and electronics belong in neither bag. Residents should set e-waste aside and hand it over separately to the waste collector, or take it directly to the Waste Management Department in Adum. Electronic waste includes old computers, laptops, monitors, keyboards, mice, printers, mobile phones, television sets, radios and decoders.

If a device runs on a battery or has a circuit board, and it is no longer needed, then it is e-waste. The practice matters because electronics discarded with ordinary refuse leak lead, mercury and cadmium into the soil and water, while burning them in the open releases toxic fumes into the air of our communities. The same devices contain copper, aluminium and gold that can be recovered safely and returned to use, which is value that Kumasi currently loses to landfills. Residents should never burn any electronic device, and should never break open television or monitor tubes because they contain leaded glass.

Items collected through the partnership are weighed, safely dismantled and sorted. Recoverable materials are extracted and routed back into productive use, while residuals are managed responsibly. Every step is documented, and the results, including kilograms diverted, units processed and emissions avoided, are published in impact reports shared with the Assembly over the six-month term. Over the term of the agreement, the partners will run scheduled collection activities, including at least one e-waste collection drive with a basic school eco-club, and will report progress toward the 15-tonne annual diversion target.

About Amoateng Technologies Limited

Amoateng Technologies Limited is a sustainability engineering company

incorporated in June 2023 and based in Kumasi, in the Ashanti Region of Ghana. The company runs four ventures, namely **Trashless Tech** (e-waste recovery), **Datum Insights** (data visualisation and impact reporting), **Datum Research and Development** (hardware engineering and material recovery optimisation) and **VetCare** (a digital veterinary marketplace), and it also builds web, desktop and mobile software.
